

COP 4934 – Summer 2026

Group 11

Meeting Notes

Date: June 2, 2026

Location: Library

1. Professor's requests for this initial team meeting:
 - i. Discuss roles within the team (see below for team roles that were discussed).
 - ii. Discuss what this project is going to consist of and how we're going to implement it. Professor mentioned that this would be the focus for the next 3 weeks.
 - iii. Discuss plans to meet in-person at least once per week.
2. Team Roles:

i.	Andrew Kelton	ML Algorithms + Front-End
ii.	Khoa Dang	Front-End
iii.	Tolgahan Poyraz	API
iv.	JC Gallo	Database / API
v.	Phillip Lintereur	ML Algorithms + Front-End / PM
3. Weekly In-Person Team Meetings: Tuesdays at 4:00 pm
4. Phillip will coordinate meetings (book meeting locations and send out notifications to team) and prepare meeting notes throughout project.
5. Tolga emailed Lee County on Thursday 5/28/2026 to request records (Tolga submitted a request form) from the sheriff office's database. The County public api limits the number of records returned to the user to 1,000. Group decided to give the County at least 7-days to process the request before following up with them.
6. Team discussed general features for the web app (to be added to and described in more detail by the team in the next 2 weeks):
 - i. General map displaying raw data from:
 - Incident records
 - Traffic records
 - ii. Map display features:
 - Zoom and pan view
 - Allow users to filter raw data displayed on the map.
 - Adjustable date range.
 - Provide list view and chart view of raw data displayed on the map.
 - Search by location
 - iii. Login option to allow users access to features such as:
 - Generating summary reports for user-selected area (allow user to draw a boundary)

COP 4934 – Summer 2026

Group 11

Meeting Notes

- iv. Clustering to characterize different regions based on crime and traffic statistics.
 - v. Heat maps to indicate differences in frequency/risk of instances of criminal activity and traffic.
 - vi. Allow user to evaluate trends in data:
 - Display heat maps for year-to-year.
 - Display activity by hours, days of the week, and weeks of the year.
 - vii. Alert user to identify increases of estimated risk in user-selected areas.
Allow user to adjust rules for monitoring locations.
7. Discussed possible structure of the database. Raw data could be stored in a read-only table, new data from the County could be regularly added (e.g. fetch data from County once a day). Other tables having mutable data could reference the raw data table and be used to support other features in the web app. These tables would be updated upon the addition of new raw data.
8. Action Items:
- i. **(Andrew)** Create GitHub repo.
 - ii. **(Everyone)** Phillip will start a document to list ideas for features for the web app. Please add to that document if anyone has any ideas for features they think would be interesting to include (also feel free to add more detail to features already listed in the document).
 - iii. **(Andrew and Phillip)** Research algorithms used to develop risk assessments based on crime and traffic statistics.
 - iv. **(Everyone)** Visit similar websites from other cities and counties for examples of features that the team might want to include for the project.
 - v. **(Phillip)** Prepare a document summarizing the data available from the County's api.
